STYLE.CSS

- A CSS (Cascading Style Sheets) files, typically named style.css , Is a style

stylesheet that defines the layout and visual styling of a web page or application.

PURPOSE:

- 1. Separation of Concerns: CSS separates the presentation layer from the structure (HTML) and behavior (JavaScript) of a web page.
- 2. Consistency: CSS enables consistent styling across multiple pages or elements.
- 3. Flexibility: CSS makes it easy to update the layout and design of a website or application.

COMMON USES:

- 1. Layout: Positioning and sizing elements (e.g., margins, padding, width, height).
- 2. Typography: Font styles, sizes, colors, and text alignment.
- 3. Colors and Backgrounds: Defining colors, backgrounds, and gradients.
- 4. Animations and Transitions: Creating visual effects and animations.
- 5. Responsive Design: Adapting the layout to different screen sizes and devices.

BEST PRACTICES:

- 1. Use a consistent naming convention (e.g., BEM, OOCSS).
- 2. Organize CSS files logically (e.g., separate files for layout, components, and utilities).
- 3. Use CSS preprocessors (e.g., Sass, Less) for complex projects.
- 4. Minify and compress CSS files for production.

DEFINE CART.HTML

- Cart.html is a HTML file that represents a shopping cart webpage, containing elements such as a header, cart items section, order summary section, and a checkout button.

- cart.html
- <!DOCTYPE html>
- <html lang="en">
- <head>
- <meta charset="UTF-8">
- <meta name="viewport" content="width=device-width, initial-scale=1.0"> <title>Shopping Cart</title>
- <link rel="stylesheet" href="style.css">
- </head>
- <body>
- <header>
- <h1>Shopping Cart</h1>
- </header>
- <main>
- <section class="cart-items">
- <h2>Your Cart</h2>
- <ul id="cart-list"> <!-- Cart items will be generated dynamically --> </ul> </section> <section class="cart-summary"> <h2>Order Summary</h2> Subtotal: ₹0.00 Tax (8%): ₹0.00 Total: ₹0.00 <button id="checkout-btn">Checkout</button> </section> </main> <script src="script.js"></script></body></html>

WHAT IS A .HTML FILE?

- - HTML = HyperText Markup Language
- It’s a static (or dynamic) web page file that a browser (Chrome, Edge, Firefox, etc.) reads and renders.
- Contains markup (tags) like <html>, <head>, <body>, , <a>, <img> etc., to structure content (text, images, links, forms, videos).-
- Can include CSS (styling) and JavaScript (interactivity) either inline or via external files.

TYPICAL USE OF PRODUCTS.HTML

- Usually a page in a website (e.g., e-commerce site) that lists products.
- Might be generated statically (pure HTML) or dynamically (JSP, Thymeleaf, React, Angular).

EXAMPLE SKELETON:

- <!DOCTYPE html>
- <html lang="en">
- <head>
- <meta charset="UTF-8">
- <meta name="viewport" content="width=device-width, initial-scale=1.0"> <title>Products</title>
- <link rel="stylesheet" href="styles.css">
- </head>
- <body>
- <header>
- <h1>Our Products</h1>
- </header>
- <section id="product-list">
-
- <h2>Product 1</h2>
- Description here.
- $19.99
-
- <!-- More products -->
- </section>
- <script src="script.js"></script>
- </body>
- </html>

QUICK POINTS

- - Extension: .html (or .htm)
- MIME type: text/html-
- Runs on: Browser (client-side)
- Can be generated: By backend (Java Servlet + JSP, Spring MVC, Node.js, PHP) or static site generators (Jekyll, Hugo).
